Single File Programming Question

Problem Statement:

Write a program to print the sum of 1 to **n**. While calculating the sum omit the number which is multiple of x
Note: Use the "continue" statement.

Input format :

The first line of the input consists of an integer n.

The second line of the input consists of an integer x.

Output format :

The output prints the sum of elements as mentioned.

Fill your code here

Python ...

```python
# You are using Python
n=int(input())
m=int(input())
sum=0
for x in  range(n):
    if(x%m==0):
        continue
    sum+=x
print(sum)
```

Problem Statement:

As part of the National Mathematics Day celebration, the Regional Mathematical Scholars Society conducted a Math Challenge event for high school students. The competition consisted of two rounds: an oral quiz followed by a written test.
In the second round, students were asked to solve the following problem:
For every positive integer **n**, define a function **streak(n) = k**, where **k** is the smallest positive integer such that **(n+k)** is **not divisible** by **(k+1)**.

Example:

- For n=13
- 13 is divisible by 1
- 14 is divisible by 2
- 15 is divisible by 3
- 16 is divisible by 4
- 17 is not divisible by 5
- So, streak(13) = 4
- For n=120
- 120 is divisible by 1
- 121 is **not** divisible by 2
- So, streak(120) = 1

Fill your code here

```python
# You are using Python
s=int(input())
n=int(input())
count=0
num=1
for i in range(1,n+1):
    for j in range(i,s+n):
        if(j%num==0):
            num+=1
        else:
            break
    if s==num-1:
        count+=1
    num=1
print(count)
```

WeCanNGO Trust is organizing a charity dinner at St. John's College. Since older students are generally wiser and wealthier, the trust has decided to set ticket prices based on how many years a student has been at the college:

- **1st-year students** buy **PINK** tickets
- **2nd-year students** buy **GREEN** tickets
- **3rd-year students** buy **RED** tickets
- **4th-year students** buy **ORANGE** tickets

Each ticket color has a unique price. Assume all tickets are sold.
Write a program to find and print **all possible combinations of tickets** that exactly total the desired fundraising amount. Combinations should be listed in the following order of priority: **ORANGE**, **RED**, **GREEN**, then **PINK**.

Additionally, your program should:

1. Output the **total number of valid combinations**.
2. Identify and display the **combination with the fewest total tickets sold**, in order to minimize printing costs.

Pyth

```python
# You are using Python
p=int(input())
g=int(input())
r=int(input())
o=int(input())
t=int(input())
count=0
c=t
for i in range(0,t+1):
    for j in range(0,t+1):
        for k in range(0,t+1):
            for l in range(0,t+1):
                if(p*i+g*j+r*k+o*l==t):
                    print("# of PINK is",i,"# of  GREEN is",j,"# of RED is",k,"# of ORANGE is",l)
                    count+=1
                    if(c>i+j+k+l):
                        c=i+j+k+l
print("Total Combinations is",count)
print("Minimum number of tickets to print is ",c)
```
